Proactive Renewal — phase 1

What the PO Box assistant needs from Emirates Post IT · revised 30 October 2026

This replaces the eleven-ask list of 29 October, following your decision to ship the basic capability first. On the scope below, **none of those eleven is needed to deliver phase 1** — four of them are now yours, four belong to work that has been set aside, and one is answered by reusing what already runs. The scope creates three new asks. All three are decisions rather than builds, and only the first has to be settled before an SMS can go out.

The scope, as we have understood it

	Phase 1	Who
Proactive notifications	You identify expiring subscriptions and send reminders at 45, 30, 7 and 1 day before expiry	Emirates Post
Direct journey launch	The link opens Mira straight in the PO Box renewal, with no welcome message in front of it	**Built**
Existing renewal flow	The current guest and signed-in renewal journeys, with payment and receipt, reused unchanged	**Built**
Contextual initialisation	A plain renewal intent on the URL. No personalised Journey IDs, no link store, no token	**Built**
Basic tracking	Journey initiation and renewal completion, to measure conversion	**Built**, one addition

Three asks

#	What we need	Kind	Priority
1	The host the reminder link points at	Decision	**Blocker**
2	What the link carries, and a marker naming which reminder it was	Decision	High
3	How the later reminders stop once a box has been renewed	Decision	High

1 The host the reminder link points at — BLOCKER

Today The assistant is served from `agent.7x.ae`. That is fine inside your pages and inside the app, where the customer is already somewhere they trust. It is not fine in an SMS.

Why A message that appears to be from Emirates Post and points at a domain customers have never seen is indistinguishable from phishing — to the customer, and to the filters that score these messages. Phase 1 puts the link in front of every expiring subscriber, so this is the first thing it runs into.

Need A host customers recognise. A redirect you control, preserving the query string, is enough and costs us nothing:

```
https://<your host>/renew?box=450293&emirate=DXB
    -> https://agent.7x.ae/embed/nxn-dialog
         ?journey=personal_po_box_renewal&box=450293&emirate=DXB
```

Epic §3

2 What the link carries — HIGH

Need The box number and the emirate code — both of which you already hold at the moment you identify the expiry — and one marker naming which of the four reminders it was.

Why the marker Without it, conversion can be reported in total but not per send, and the thing you most want to know from phase 1 is which of 45, 30, 7 and 1 actually earns the renewal. You set it; we read it and attach it to the journey, and it reaches the completion event unchanged.

```
?journey=personal_po_box_renewal   fixed
&box=450293                        the box number
&emirate=DXB                       DXB | AUH | SHJ | …
&src=r45                           r45 | r30 | r7 | r1   (optional, recommended)
```

Epic §3.1, §17

3 How the later reminders stop — HIGH

The case Four sends at 45, 30, 7 and 1. A customer who renews on day 30 must not be chased on day 7 and again on day 1. This is the most visible way phase 1 can embarrass itself: the customer paid, and was written to twice more.

Simplest Your scheduler re-reads the subscription's status immediately before each send. You hold that record, the renewal lands in it, and nothing is needed from us — we only need to know that this is what happens.

If not Either give us an endpoint to call when a renewal completes, or read it from your own renewal record before each batch. We would rather not hold a second copy of your subscription state.

Epic §1.1, §16

Two things to know — no action needed

The renewal is reachable by box number alone, and that is deliberate. Guest renewal never asks for a passcode or a sign-in — your rule, and the reason the journey exists — so the link needs no token, and anyone typing a box number reaches the same place with or without an SMS. What that exposes is already bounded: the holder's name comes back masked (`M********** A**** *****B`), the assistant is forbidden from completing it or ever stating it in full, and what remains visible is the bundle, the term and the price. Recorded here so the decision is on the record, not because anything changes.

Dropping the Journey ID drops a whole slice, not a field. No link store, no opaque single-use token, no 24-hour expiry — we have taken all of it out of phase 1, which is most of why the estimate fell. If you later want a link that expires, or one that carries the customer past sign-in, it returns as work on both sides; it is not something that can be bolted onto a plain URL afterwards.

Already built — nothing needed from you

What	Where it stands
Opening straight into the renewal from a URL	Live. `?journey=…&box=…&emirate=…` on the embed, and `window.Dialog.start({…})` for the app.
The one-tap renewal entry	Live. The first message names the box and the term, so the reply is the summary and the pay button at once.
Guest and signed-in renewal, payment, receipt	Live and unchanged. Phase 1 reuses them exactly as they are.
Journey initiation and completion events	`journey.started` and `journey.completed` are already emitted and already drive the conversion view.
The renewal reminder pill on sign-in	Live. A customer who signs in with a box about to expire is offered the renewal as one button.

Built and running on staging. Switching each on in production is a configuration run on our side, not a release.

What we add for phase 1

Carrying `src` from the link onto the journey's analytics so conversion can be read per reminder, and the view that reports it. Days, not weeks — the rest of phase 1 is already standing.

Set aside, and what brings each back

Was	Now
A — a feed of subscriptions approaching expiry	Yours. You identify them; we never hold your customer list.
B — corporate contacts and the recipient rules	Yours. Your contacts, your rule, your opt-out record.
C — who sends SMS, WhatsApp and push	Answered: you do.
I — a pre-send check that a box is not already renewed	Yours, and it becomes ask 3 above.
D — filing a corrected document on a subscription	Returns with in-conversation document fulfilment (§7.2).
E — the licence / ownership lookup in production	Returns with the owner check that depends on it (§7.1).
G — eligibility, VIP and correction rules as a service	Returns with the VIP and correction branches (§9, §14).
H — inquiry status and a close notification	Returns with in-conversation inquiry handling (§9.2).
F — the authenticated renewal operations	Not needed: phase 1 reuses the guest path, which already works signed in.

J and K from 1 September — releasing a box hold, and the registration fee before a box is held — are untouched by this scope and remain open.
